AFTER-SALES INFRASTRUCTURE

Welcome to Shona

Here to streamline your after-sales process. Recover value and maintain your customers.

Shona helps your clothing brand recover damaged inventory and gives your customers a trusted way to repair and alter garments they've purchased — while generating operational intelligence for your business.

Customer Retained

Stays in brand ecosystem

+ Brand Loyalty Retained

Customer stays in ecosystem with a positive after-sales experience

BOTH EXPERIENCES FEED →

Operational + Product Intelligence

Every repair, alteration and recovery generates data that helps brands improve product design, materials and sizing.

[See Operational Intelligence →](#)

INFRASTRUCTURE, NOT A MARKETPLACE

Your After-Sales Process, Structured and Visible

Shona is the operational layer your clothing brand needs to handle what happens after the sale — without building it yourself.

01

Recover Value

Damaged or defective inventory doesn't have to be written off. Shona coordinates specialist assessment and repair so garments can re-enter your stock at full or partial value.

02

Retain Customers

When a customer's garment needs repair or alteration, Shona gives them a trusted, structured channel — keeping them in your brand ecosystem rather than losing them to a generic tailor.

03

Learn from After-Sales Data

Every repair and alteration generates structured data about which garments, materials and designs need attention. Shona turns service activity into product and manufacturing intelligence.

WHY INFRASTRUCTURE MATTERS

Not a repair marketplace. A service layer for your brand.

Marketplaces commoditise your after-sales activity and dilute your brand. Shona operates as white-label infrastructure —

- ✓ Intake and specialist coordination
- ✓ Logistics and communication
- ✓ Price transparency + customer approval
- ✓ Structured data capture
- ✓ Brand-aligned customer experience

your brand. Shona operates as white label infrastructure so your customers interact with a service that feels native to your brand, while Shona coordinates the logistics, specialists and communication behind the scenes.

Technical questions about your repair or alteration

**Automated tracking updates via WhatsApp**

You receive status updates at every key milestone. Reply YES to approve and proceed to payment. No human agent needed for standard journeys.

**Need to speak to a specialist?**

For technical questions about your repair, use the specialist chat from your booking page — that's a separate conversation with a human seamstress.

[Go to Assessment + Pricing page →](#)

Transparent. Upfront. Paid Before Work Begins.

You see the price before you commit. You pay before we collect. No surprises after the garment has left your hands.

Why payment before pickup?

Shona coordinates pickup, delivery and specialist work — all of which have a cost regardless of what happens after collection. Upfront payment protects both parties: the customer pays a confirmed price, and the specialist can begin work without waiting for settlement. It also removes awkward payment chasing at the point of return.

1

Price Shown

Customer sees the exact price or range upfront before booking

2

Assessment (if needed)

Complex issues reviewed by specialist — final price confirmed before proceeding

3

Customer Approves

Customer confirms they are happy with the price

4

Customer Pays

Payment collected upfront — before garment is collected for work

5

Pickup + Work

Garment collected, work completed by specialist

6

⚠ **Important separation:** Customer garment tracking (the customer's repair journey) is never mixed with Brand Tracking Insights (inventory recovery). These are distinct experiences with distinct data flows.

RESEARCH-INFORMED DESIGN DECISIONS

10 Key UX Decisions

These decisions were made in response to the design brief and informed by UX research principles. They are clearly labelled as design decisions and are separate from the original Shona source material.

01 Progressive Disclosure

Booking is broken into 5 focused steps rather than a single long form. Each step collects only what's needed at that point, reducing cognitive load and abandonment.

Why this decision

Users complete shorter tasks more readily. Collecting information progressively also mirrors how specialists assess work in practice.

02 Predictable Pricing

Common service types show price ranges upfront (e.g. 'Waist alteration: KES 800–1,200'). Assessment is required only where diagnosis is genuinely uncertain.

Why this decision

Price uncertainty is a primary barrier to after-sales service uptake. Structured pricing reduces friction and builds trust — the same reason Uber shows fares before booking.

03 Structured Intake Before WhatsApp

Customers complete garment intake and issue selection digitally before any human conversation. WhatsApp is used for approval and updates, not as a substitute for structured data.

Why this decision

WhatsApp-first onboarding generates unstructured data that is hard to act on. A digital intake form creates structured records from the start.

04 Calendar-Based Scheduling

Pickup scheduling uses a calendar and predefined time slots. Customers select availability without negotiation.

Why this decision

Manual scheduling (back-and-forth messages) creates friction and operational overhead. Structured slots reduce both.

05 Address Form First, Map Second

The address collection step leads with a structured form. The map is displayed as a secondary visual confirmation, not the primary input method.

06 Customer Tracking vs Brand Inventory Tracking — Separated by Design

The customer's garment tracking (their repair journey) and the Brand Portal's Tracking Insights (inventory recovery) are distinct interfaces with different data

distinct interfaces with different data.

Why this decision

In many African cities, map-pin accuracy is unreliable. Address forms create structured, actionable location data. Maps help confirm but should not gatekeep.

Why this decision

Conflating these would create confusion, erode customer trust, and misrepresent brand inventory data as customer-facing information. Strict separation is both a UX and trust requirement.

07 Human Specialist Escalation

When pricing or diagnosis is uncertain, the booking flow surfaces an 'Assessment Required' state and routes the customer to a specialist — not to a dead end.

Why this decision

Not all issues can be priced at intake. Honest uncertainty, followed by a clear escalation path, builds more trust than a false price.

08 Readable Catalogue / Table Design

The Tracking Insights and Inventory Recovery tables use generous row height, soft borders, and clear column hierarchy. Status is colour-coded but also text-labelled.

Why this decision

Dense tables cause decision fatigue. Spacious, scannable layouts with clear state labels reduce the mental effort required to act on data.

09 Operational Data Captured Throughout the Journey

Every step of the booking and repair flow captures structured data — garment type, material, issue type, repair outcome — that feeds the Operational Intelligence view.

Why this decision

After-sales data becomes a product asset only if it's structured at source. The booking design is built to generate useful data, not just to process bookings.

10 WhatsApp as Communication Layer

WhatsApp is used for two defined purposes: automated status updates (tracking) and specialist chat (diagnosis). It is not the system core — the digital interface is.

Why this decision

WhatsApp has very high adoption in target markets. But using it as the core system creates unstructured workflows. Positioning it as a communication layer preserves its reach while keeping data structured.
